An Introduction To Time Series

Introduction to Time Series Analysis. Time series methods take into account possible internal structure in the data. Time series data often arise when monitoring industrial processes or tracking corporate business metrics. The essential difference between modeling data via time series methods or using the process monitoring methods discussed earlier in this chapter is the following:

A time series forest (TSF) classifier adapts the random forest classifier to series data. Split the series into random intervals, with random start positions and random lengths. Extract summary features (mean, standard deviation, and slope) from each interval into a single feature vector. Train a decision tree on the extracted features.
