common type of factoring in Algebra. In this lesson, we will factor trinomials that have a lead coefficient of 1. To begin this lesson, it is important for you to understand the process of multiplying binomials using the FOIL method. Please be sure to review that lesson before starting this lesson.

Possible Answers:

Correct answer:

Explanation: For the trinomial to be factorable, we would have to be able to find two integers with product 36 and sum ; that is, would have to be the sum of two integers whose product is 36. Below are the five factor pairs of 36, with their sum listed next to them.

Factoring Trinomials in the form $x^2 + bx + c$.
To factor a trinomial in the form $x^2 + bx + c$, find two integers, r and s , whose product is c and whose sum is b . Rewrite the trinomial as $x^2 + rx + sx + c$ and then use grouping and the distributive property to factor the polynomial. The resulting factors will be $(x + r)$ and $(x + s)$.

How to factor expressions. If you are factoring a quadratic like x^2+5x+4 you want to find two numbers that. Add up to 5. Multiply together to get 4. Since 1 and 4 add up to 5 and multiply together to get 4, we can factor it like: $(x+1)(x+4)$

rewrote (factored) quadratic expressions as the product of two linear factors. This helped them learn about the behavior of quadratic functions. In Algebra 2, we extend this idea to rewrite polynomials in degrees higher than 2 as products of linear factors. This will help us investigate polynomial functions.
