A fault in a power system is in one of the following forms: one phase shorted to ground, two-phase lines shorted together, two-phase lines shorted to ground, all phases shorted to ground, one line open, and two lines open. In the case of any of these faults, if a system is not provided with the proper protective means, the consequences are costly.

A three phase fault is a condition where either (a) all three phases of the system are short- circuited to each other, or (b) all three phase of the system are earthed. This is in general a balanced condition, and we need to only know the positive-sequence network to analyse faults.

Application-based three-phase fault analysis. We can analyze three-phase faults by using a simple circuit as shown below. In this temporary and permanent faults are created by fault switches. If we press the button once as a temporary fault, the timer's arrangement trips the load and also restores the power supply back to the load.
