In real life, all control systems are non-linear systems (linear control systems only exist in theory). The describing function is an approximate procedure for analyzing certain nonlinear control problems. Examples of Non-linear System A well-known example of a non-linear system is a magnetization curve or no load curve of a

Control System
Consider a purely resistive network with a constant DC source. This circuit follows the principle of homogeneity and additivity. All the undesired effects are neglected and assuming ideal behavior of each element in the network, we say that we will get linear voltage and current characteristic.

...

Stability is one of the important characteristics of control systems analysis. In the linear sense, the stability is characterized by the system producing a bounded output when excited by a bounded input (Ogata, 1979).
