The Cyclotron . Erenst O Lawrence was a brilliant American nuclear physicist who is credited with the invention of the cyclotron, the compact particle accelerator, which is still used in nuclear physics laboratories.The cyclotron, despite being eclipsed by its larger, cumbersome cousins, the linear accelerators, can energize sub-atomic particles fairly easily while saving the space, normally ...

As it is clear from the above equation that the cyclotron frequency is inversely proportional to mass of the ion. The frequency of revolution is apparently constant for ordinary ions. If an electron is accelerated in a cyclotron, it quickly picks up high-speed comparable to the speed of light because of its light mass.

Tiny cyclotron. Cyclotrons accelerate charged particles as they orbit in circles in a magnetic field. Researchers have now created the smallest possible cyclotron—a single orbiting electron in a small cavity—a dramatic contrast with the progressively larger machines built since this original 5-inch diameter model from 1931.

Electron cyclotron resonance (ECR) plasma sources are used for a variety of materials processing applications such as semiconductor etching and deposition. Their use in research became widespread in the late 1980's and ECR-based tools have now entered production. ECR plasma sources are termed electrodeless because they do not depend on current flowing to an electrode.
