Unfortunately, most modeling tools cannot even draw logical data model. Instead, they use UML class notation and class attributes to represent logical data model and that is the main reason why is it possible to specify data-types in such modeling tools. But again, that model is more of a class diagram than a logical data model.

The main difference between logical and physical data model is that logical data model helps to define the data elements and their relationships, while physical data model helps to design the actual database based on the requirements gathered during the logical data modelling.. Generally, it is necessary to model data before storing them to the database.

What is the Difference Between Logical and Physical Data Model

Data modeling is a technique to document a software system using entity relationship diagrams (ER Diagram) which is a representation of the data structures in a table for a company's database. It is a very powerful expression of the company's business requirements. Data models are used for many purposes, from high-level conceptual models, logical to ...
