This book treats some of the central problems involved in these networks of the future. First, how does one switch data at speeds orders of magnitude faster than that of existing networks? This problem has roots in both classical switching for telephony and in switching for packet networks. There are a number of new twists here, however.

Congested traffic. Data show a weaker relationship between flow and density in congested conditions. Therefore, Kerner argues that the fundamental diagram, as used in classical traffic theory, cannot adequately describe the complex dynamics of vehicular traffic.He instead divides congestion into synchronized flow and wide moving jams.. In congested traffic, the vehicle speed is lower than the ...

Three phase traffic theory developed by Russian physicist Boris Kerner explains the congestion by the phase transition in traffic system. In the three phases traffic theory, the three phases in traffic are consist of free flow and two congestion phases: synchronized flow and wide moving jam.

In the field of telecommunications, a Clos network is a kind of multistage circuit-switching network which represents a theoretical idealization of practical, multistage switching systems. It was invented by Edson Erwin in 1938 and first formalized by Charles Clos (French pronunciation:) in 1952.. By adding stages, a Clos network reduces the number of crosspoints required to compose a large ...

The normal function of traffic lights requires more than slight control and coordination to ensure that traffic and pedestrians move as smoothly, and safely as possible. A variety of different control systems are used to accomplish this, ranging from simple clockwork mechanisms to sophisticated computerized control and coordination systems that self-adjust to minimize delay to people using the ...

Okay, in the last lecture, I explained traffic allocation on different routes, can be determined by Nash equilibrium in a very much simplified version of traffic game. So, now I'd like to explain how it works in reality, okay? So I'm going to present an empirical or Theo- theoretical study. About, the traffic around Hamamatsu city in Japan.

When the button is pushed, traffic will stop in all directions to allow people to cross. The town has decided to hire you to design a traffic light for them. Since it is a small town, you may use the following sequence: For the first 4 clock cycles, North/South (NS) should have the red light on while East/West (EW) should be green.
